Original Paper

The Inclusion of Ethnic Minority Patients and the Role of Language in Telehealth Trials for Type 2 Diabetes: A Systematic Review

Talia Isaacs^{1*}, PhD  ; Daniel Hunt^{2*}, PhD  ; Danielle Ward³, MPH  ; Leila Rooshenas⁴, PhD  ; Louisa Edwards⁴, PhD 

Underrepresentation of black and ethnic minority patients in clinical trials must be addressed

BAME patients may be underrepresented in trials for diabetes treatment, study finds

Language could affect minority community participation in diabetes research trials

Open access article: <https://www.jmir.org/2016/9/e256/>

Image attribution: <https://www.maxpixel.net/photo-1000859>

LTRC conference abstract: *How is language proficiency operationalized in randomized controlled trials (RCTs) in healthcare settings?*

Reviewer 2: This is a highly novel and interesting topic which demonstrates a clear cross-over between medical health researchers and language proficiency. This paper would be a valuable addition to the conference program.

Reviewer 1: I don't think this is an interesting topic for the conference. The focus is the underrepresentation of minority groups in clinical research. Not clearly a study for a language testing audience. It would be more appropriate for a conference on medical research design.

E-mail: Hello & bias against interdisciplinary - LTRC
“Language testers really need to know about these issues & their input is crucial to addressing this area, which is high-stakes for many patients. The topic also fits closely with the conference theme: “any aspect of the interface among language constructs, contexts & content (or disciplinary subject matter, themes, topics, etc.) in language assessment...””

Reviewer 1: I don't think this would be interesting to most conference participants. The focus is the underrepresentation of minorities in medical research. Not clearly a study for a language testing audience. It would be more appropriate for a conference on medical research design.

LTRC conference chair:

- Theme (context + constructs) not explicitly expressed in title or abstract
- Do not think this was interdisciplinary “bias”
- **My reply:** Relevance to conference theme strongly implied

TITLE: *How is the language proficiency construct operationalized in randomized controlled trials (RCTs) in healthcare settings?*

In the doghouse

<https://www.flickr.com/photos/nycgeo/6450561201>

My reply: “Reviewer 1 was not commenting on the conference theme. He/she seemed to feel that the topic was not interesting to most conference goers & “not clearly a study for a language testing audience”----- hence my view on interdisciplinary bias. I personally think this reflects a narrow mentality of what fits and doesn't fit into the language testing box, although Reviewer 2 appears to have contradicted this with a more positive response.”

O'Sullivan & Isaacs lunchtime workshop

- Writing an abstract

We will work through examples of more successful abstracts

How is language proficiency operationalized in randomized controlled trials (RCTs) in healthcare settings?

Randomized controlled trials (RCTs) are the gold standard of health intervention research. However, patient recruitment targets, leading to certain sociodemographic groups being underrepresented. Particularly pressing concerns are for conditions that disproportionately affect minority groups due to their greater need for those clinical interventions (Bartlett et al., 2010).

One challenge to minority participation in RCTs relates to patients' language proficiency. Research has demonstrated greater potential for miscommunication when there is a mismatch between the patient's and health professional's primary language than when they share the same mother tongue (Segalowitz & Kehaviah, 2011). Ensuring adequate language ability is

Talia Isaacs^{1*}, PhD  ; Daniel Hunt^{2*}, PhD  ; Danielle Ward³, MPH  ; Leila Rooshenas⁴, PhD  ; Louisa Edwards⁴, PhD 

Underrepresentation of black and ethnic minority patients in clinical trials must be addressed

BAME patients may be underrepresented in trials for diabetes treatment, study finds

Language could affect minority community participation in diabetes research trials

Open access article: <https://www.jmir.org/2016/9/e256/>

Image attribution: <https://www.maxpixel.net/photo-1000859>

Why an interest in randomized controlled trials (RCTs)?

- ▶ Considered gold standard of health intervention research (Meyer et al., 2019)
 - Test effectiveness & safety of new medical treatments
- ▶ **BUT** difficulty recruiting enough patients → underpowered studies (Donovan et al., 2014)
 - cost & resource implications
- ▶ Recruited sample should be representative of the target population (Bartlett et al., 2005)
 - External validity
 - Equitable access to health services; inclusion

Focus of systematic review (1/2)

Type 2 diabetes

- ▶ Ethnic minorities vulnerable
- ▶ In the UK compared to Caucasians, incidence
 - up to 6x higher → South Asian descent
 - up to 3x higher → African/Afro-Caribbean descent
- ▶ poorer outcomes (Negandhi et al., 2013)

BUT underrepresented in RCTs

- stand to benefit the most from participating

Focus of systematic review (2/2)

Telehealth RCTs

- ▶ Telehealth = remote healthcare delivery, telecommunications technology (Ackerman et al., 2010)
 - universally accessible?
 - heightened language demands → some telehealth interventions
 - E.g., phone more difficult than face-to-face

RCTs & the role of language

Need to find out

- ▶ whether & how trial recruiters determine that patients have the requisite language proficiency to
 - provide informed consent
 - ethical imperative, applies to ALL RCTs
 - engage with the intervention
- ▶ Link between language screening & ethnic composition of the recruited sample
 - could studies that refer to language requirements deter hard-to-reach patients from participating?

Research objectives: Examine

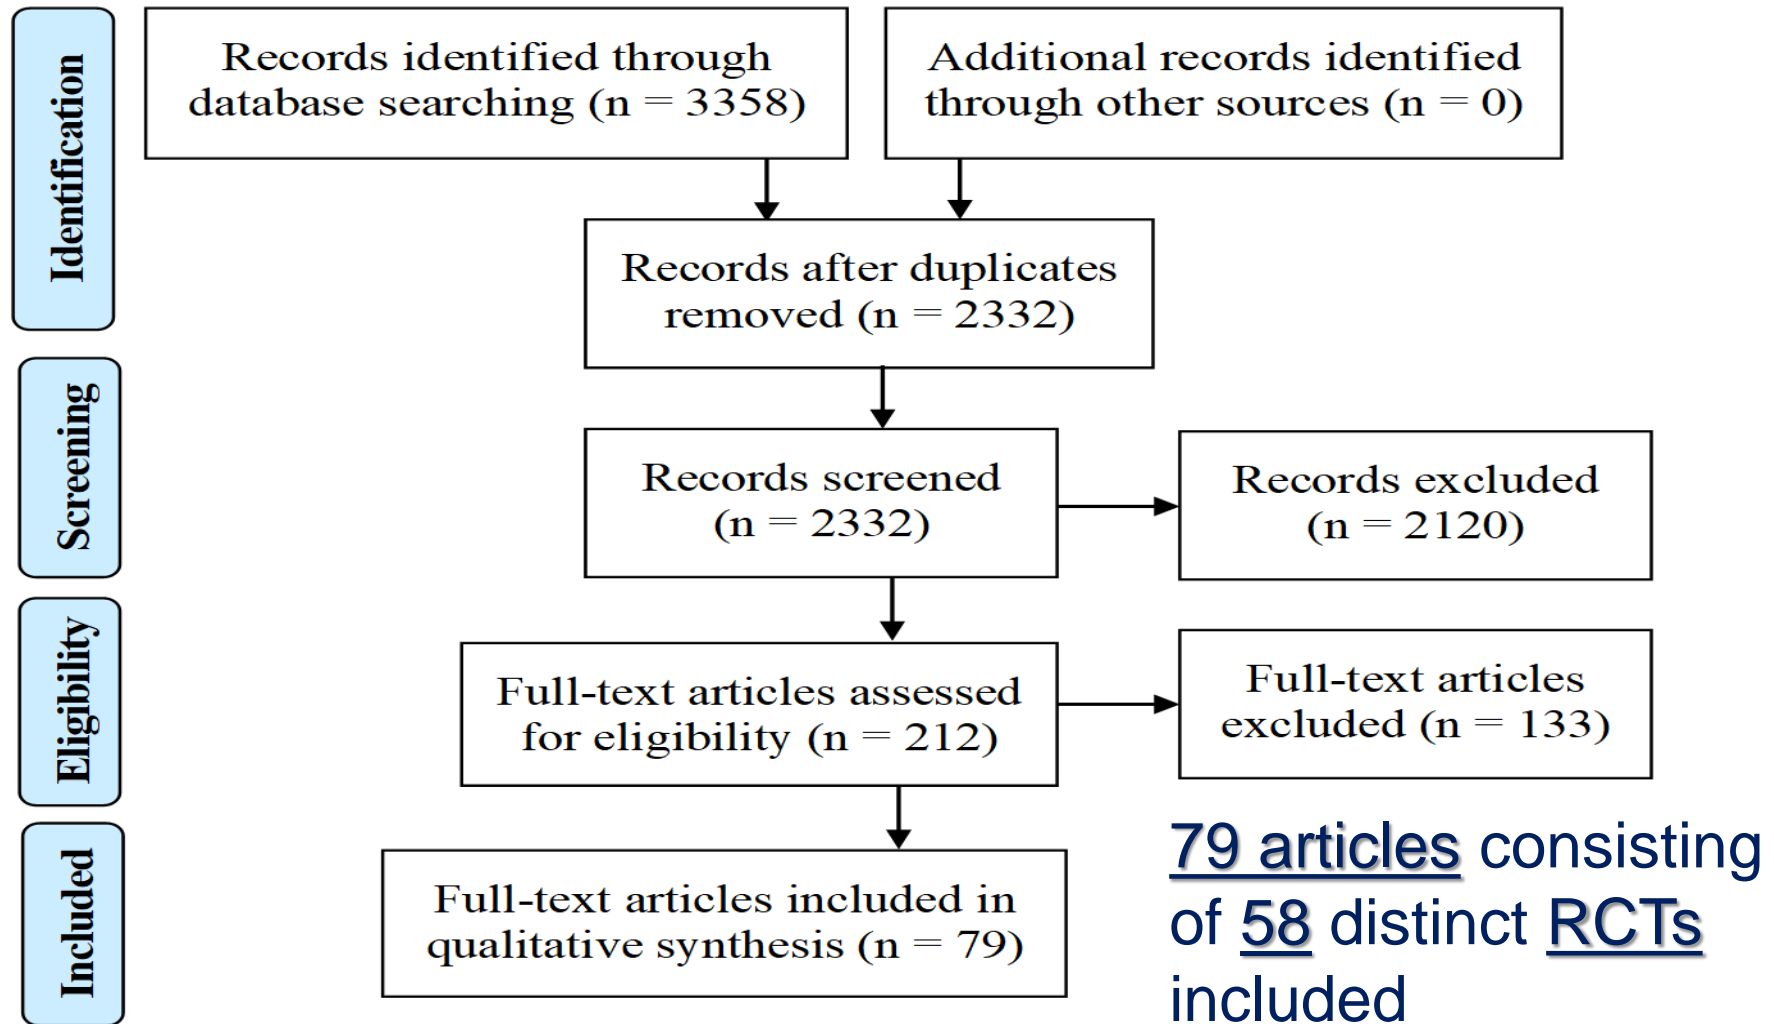

- ▶ Research reporting & prevalence of ethnic minorities recruited to telehealth diabetes RCTs
 - trial characteristics associated with successful recruitment
- ▶ Role of language & its prevalence as a screening criterion
 - operationalization of language proficiency in making patient inclusion/exclusion decisions

1st systematic review on telehealth diabetes RCTs to focus on language

Methods: Study selection criteria

- ▶ peer-reviewed articles in English
- ▶ recruiting adult patients with type 2 diabetes
 - Western countries; English official & majority language
 - Australia, Canada, Ireland, New Zealand, UK, US
- ▶ not ethnically-targeted
- ▶ intervention: any telehealth medium
- ▶ Excluded RCTs also targeting gestational or type 1 diabetes

Methods: Prisma diagram & search strategy

Selection of eligible studies. Searched MEDLINE, PsycINFO, EMBASE, CINAHN, CENTRAL & references of related reviews

Methods: Data extraction

2 independent reviewers recorded study methodological details, participant demographics & intervention characteristics

English language/literacy part of inclusion/exclusion criteria?	Yes/No/Multilingual (if English is one of two or more languages permitted)
Reason(s) English language required	Informed consent/ethics; Fitness of/ability to participate in the intervention; Lack of resources; Other (specify); None given
Language proficiency definition/operationalization	Note: Provide the description then categorize according to the language skill emphasized (speaking, listening, reading, writing), whether phone communication is specified, etc.
Compensation provided for participation?	Yes (elaborate)/No
Translation/interpretation included/bilingual interventionists	Yes (elaborate)/No

Methods: Risk of bias assessment

2 independent reviewers assessed methodological quality of included studies

Results - Ethnicity

- ▶ $< 2/3$ of included RCTs (38/58) reported on ethnic composition of recruited sample
 - Median proportion of ethnic participation: **23.5%**, range: 0%–97.7%
- ▶ $< 1/4$ (14/58) recruited a sizeable proportion of ethnic minorities ($\geq 30\%$ of total recruited sample)
 - All US-based
 - Urban areas; mostly deprived, underserved, or uninsured patients

High (14/28) vs. low (14/28) ethnic minority recruiting RCTs

- ▶ High (≥ 30 minority recruitment)
 - 8/14 offered intervention in both English & Spanish
 - E.g., bilingual staff, phone interventions
 - 2 used interpretation/translation during recruitment; 4 cultural tailoring for ethnic minorities, 6 tailoring for low literacy
- ▶ Low ($\leq 30\%$ minority recruitment)
 - no bilingual provision offered

Results - Ethnicity

Headlines tell part of the story

BAME patients may be underrepresented in trials for diabetes treatment, study finds

Underrepresentation of black and ethnic minority patients in clinical trials must be addressed

- ▶ Ethnic minorities underrepresented
 - Unclear whether the intervention being tested is safe & effective
- ▶ Telehealth delivery mode mixed across high minority recruiting studies

<https://medicalxpress.com/news/2016-09-bame-patients-underrepresented-trials-diabetes.html>

<http://www.bristol.ac.uk/policybristol/news/2016/bame-diabetes-trials.html>

Results - Language proficiency

- ▶ Half of included RCTs (29/58) reported patient language proficiency as an eligibility criterion
 - Underreported or language not considered?
 - 4000 word journal articles
- ▶ No common procedures/instruments across RCTs to determine patients' eligibility on language grounds
 - No mention of CEFR levels

How language operationalized - 29 RCTs reporting it as screening criterion

- ▶ 9 - speak/communicate in English
 - E.g., "must speak English" (Quinn et al., 2011)
- ▶ 2 - speak & understand
 - E.g., "Ability to clearly speak/understand English via telephone" (Williams et al., 2012)
- ▶ 4 - speak & read
- ▶ 2 - read & understand
- ▶ 7 - read & write
- ▶ 5 - English (or Spanish) primary/main language; native speakers
 - E.g., "excluded patients who... were non-English speaking" (Ralston et al., 2009)

Examples of mismatch between telehealth medium & language skills reportedly screened

RCT	Language screening criterion	Telehealth medium
Glasgow et al. (2012)	“ability to read & write in English or Spanish“	Interactive website, telephone calls (automated & human)
Carter (2011)	Exclusion: " Illiteracy or inability to read at an eighth grade reading level” <u>“Brief test” to assess literacy (no details given)</u>	Laptop with home monitoring, videoconference & online personal health record

Headlines tell part of the story

Language could affect minority community participation in diabetes research trials

- Language mentioned as eligibility criteria in only half of included RCTs
- Operationalization of language proficiency haphazard
 - No standardized instruments or common/procedures for measuring it
 - Little guidance for recruiters on how to assess it

<https://www.diabetes.co.uk/news/2016/sep/language-could-affect-minority-community-participation-in-diabetes-research-trials-90437085.html>

Implications

- ▶ Inclusion/exclusion decisions depend on trial recruiters' subjective judgments
 - strong potential for bias
 - e.g., perceptible L2 accent that does not impede communication
 - including patients who do not understand the nature of the intervention due to language barriers also problematic (unethical)

Future research

- ▶ Design a simple, practical means to more fairly & consistently screen patients' language proficiency in RCT recruitment
 - minimize the possibility of patients being unfairly excluded based on arbitrary human decision-making on language grounds
 - One-size-fits all instrument for use across RCTs?
 - Possible to identify threshold level?
 - Role of health literacy?

Take-home message

- ▶ Examples from this talk demonstrate that whether or not something is

- subject to change over time
- in the eye of the beholder

Thank you!
